with highly hydrophilic peptide structure.";
J. Neurochem. 67:89-97(1996).
--- FUNCTION: THIS PROTEIN IS AN ANTICOAGULANT PROTEIN THAT ACTS AS
AN INDIRECT INHIBITOR OF THE THROMBOPLASTIN'S-PECIFIC COMPLEX,
WHICH IS INVOLVED IN THE BLOOD COAGULATION CASCADE.
--- SUBUNIT: MONOMER. Binds ATRX and DNWT1.
--- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
                                                                                                                      calcium and phospholipid.
SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
SIMILARITY: Contains 4 annexin repeats.
                                                                                                                                                                                                                                                                                                                             , M21730; AAA41512.1; -, D42137; BAA07708.1; -, D42129; BAA07708.1; -, D42130; BAA07708.1; JOINED. Mol. Biol. 260:638-643(1996).
-1- FUNCTION: MAY ASSOCIATE WITH CD21. MAY REGULATE THE RELEASE OF CA(2+) FROM INTRACELLULAR STORES.
-1- INDUCTION: BY EBV.
-1- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -1- PTM: PHOSPHORYLATED IN RESPONSE TO GROWTH FACTOR STIMULATION.
-1- MISCELLANEOUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY.
-1- SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
-1- SIMILARITY: Contains 8 annexin repeats.
                                                                                                                                                                                                             "Primary structure of the human, membrane-associated Ca2+-binding protein p68 a novel member of a protein family."; EMBO J. 7:21-27(1988).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -i. DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
-i. MISCELLANGOUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY.
-i. SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
-i. SIMILARITY: Contains 8 annexin repeats.
                                                                                                                                                                                                                                                                                                                                  Moss S.E., Crompton M.R., Crumpton M.J.;
"Molecular cloning of murine p68, a Ca2+-binding protein of the
lipocortin family.";
Eur. J. Biochem. 177:21-27(1988).
--i- FUNCTION: MAY ASSOCIATE WITH CD21. MAY REGULATE THE RELEASE OF
CA(2+) FROM INTRACELLULAR STORES.

        DOWAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
MISCELLAMEGUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY. SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.
SIMILARITY: Contains 8 annexin repeats.
                                                                                                                                                                                                                                                                                                                                                                   ö

Submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: CALCIUM/PHOSHOLIPID-BINDING PROTEIN WHICH PROMOTES

-!- DOMAIN: A Pair of annexin repeats may form one binding site for calcium and phospholipid.

-!- DOMAIN: A SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY

-!- MISCELLANEOUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY

Submitted (SEP-1994) to the EMBL/GenBank/DDBJ databases.
-I- FUNCTION: CALCIUM/PHOSPHOLIPID-BINDING PROTEIN WHICH PROMOTES
MEMBRANE FUSION AND IS INVOLVED IN EXOCYTOSIS (BY SIMILARITY).
-I- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.
-I- MISCELLANEOUS: SEEMS TO BIND ONE CALCIUM ION WITH HIGH AFFINITY
Chordata; Craniata; Vertebrata; Euteleostomi;

                                  The present sequence is a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thromb or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively reheate a radiouncilde and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistriae that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                   chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In distribution of conjugation chemistries that provide a distribution of conjugation the site of biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MAGGCGHMAOVLRGTVTDFPGFDERADAETLRKAMKGLGTDEESILTLLTSRSNAOROEI

                                                                                                                                                     The present sequence is a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radiouncide and retain annexin bloactivity. It can be readily prepared in high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  247
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This vascular anti-coagulating protein (VAC)-alpha is used in the preparation of monoclonal antibodies (MAbs). The VAC-alpha is injected into a host animal, in conjugation with eap keyhole limper haemocyanin, and the B-cells from immunised hosts are then fused with myeloma cells. The resultant hybridomas (VAA-8 and VAA-9) produce Abs specific to VAC-alpha. Abs can be used as immunossay reagents to detect VAC proteins, as affinity ligands for protein purifico, and as medicaments for binding and/or neutralising VAC proteins in vivo. See also AAN91354 and

The proteins are bifunctional Aequorea victoria green fluorescent protein composed annexin fusion proteins, where the GFP and annexin moleties provide greater or equal fluorescent intensity and anionic phospholipid binding affinity, respectively, than do the corresponding unfused GFP and annexin proteins. An early manifestation of apoptosis is the loss of the asymmetric distribution of plasma membrane phospholipids, which results in exposure of anionic phospholipids on the extracellular leaflet of the plasma membrane. The GFP-annexin V fusion proteins are used for the detection of apoptotic cells by flow cytometry or fluorescent microscopy. The fusion proteins provide for homogeneously labelled annexin, with fluorescence properties that do not change upon binding membrane phospholipids, unlike prior art FITC-labelled annexins, where quenching or FITC-annexin V fluorescence by 40-50% occurs upon binding phospholipid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents an annexin polypeptide. The domain of annexin, which may be modified, is used to construct the chemical compounds of the invention. The specification describes chemical compounds which have an affinity for a phospholipid. The chemical compounds comprise at least one chemical platform comprising six residues supporting a set of chemical functions that are capable of binding to the phospholipid and at least partly define the affinity of the structure for the phospholipid. The compounds act as phospholipid sequesters. The compounds are useful for preparing antithrombotic, antitumor and antiinflammatory medicaments, for making coatings for thrombogenic biomaterials, and for preparing labelling compounds useful for analysing and detecting negative
